This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Claims 1-20. (canceled).

Claim 21. (previously presented): An input device, comprising: a flexible carrier:

at least one cap connected to a top surface of the flexible carrier, wherein the cap is movable when force is applied to a surface of the cap; and

at least one fixing means, arranged beneath a first plane that includes the at least one cap, and above a second plane of the flexible carrier connected to the cap, wherein the at least one cap, and the flexible carrier, is configured in such a way that the force can be transmitted in a substantially punctual manner through a plane that includes the fixing means and wherein the fixing means, in one area of at least one terminal edge, secures the input device in or on a housing.

- Claim 22. (previously presented): An input device according to Claim 21, wherein the fixing means comprises a metal sheet.
- Claim 23. (previously presented): An input device according to claim 21, wherein the fixing means is configured as a lattice with recesses, through which the at least one cap can move in a direction of actuation.
- Claim 24. (previously presented): An input device according to claim 21, wherein the at least one cap has, perpendicular to a direction of actuation in at least one spatial direction, a dimension that is greater than an opening in the fixing means.

Appl. No: 10/538,930

Response to Office Action dated December 31, 2007

Claim 25. (previously presented): An input device according to claim 21, wherein the cap is configured on an operable exterior or user interface to project over the respective recess and to protrude through the recesses.

Claim 26. (previously presented): An input device according to claim 21, wherein the cap has, at least in one sectional plane parallel to the direction of actuation, an approximately mushroom-like cross-sectional form.

Claim 27. (previously presented): An input device according to claim 23, further comprising at least one projection on the flexible carrier, wherein said at least one projection are configured to protrudes through the recesses in the stable fixing means and is covered by a respective at least one cap fixed on the projection.

Claim 28. (previously presented): An input device according to claim 21 wherein at least one terminal edge of the fixing means is configured as a type of overlapping periphery and/or flange for securing the input device in or on a housing.

Claim 29. (previously presented): An input device according to claim 21, wherein two respectively opposing terminal edges of the fixing means are configured as a type of overlapping periphery and/or flange.

Claim 30. (previously presented): An input device according to claim 21, wherein fixing means is inserted loosely into the respective housing, especially where the span widths or opening widths of a housing aperture or of a keyboard opening are small.

Claim 31. (previously presented): An input device according to claim 21, wherein the fixing means is connected to the housing rigidly and/or in one piece, whereby the fixing means is preferably configured as a punched and bent sheet-metal part.

3

Appl. No: 10/538,930

Response to Office Action dated December 31, 2007

Claim 32. (previously presented): An input device according to claim 21, wherein the fixing means and an associated housing part are configured from one material and are manufactured in one piece in an essentially joint production step.

Claim 33. (previously presented): An input device according to claim 21, wherein the fixing means forms a three-dimensional keypad surface or user interface.

Claim 34. (previously presented): An input device according to claim 21, wherein the fixing means is configured as an ESD protection.

Claim 35. (previously presented): Input device according to claim 21, wherein the input device is one of a mobile telephonic device and mobile computing device.

Claims 36-39. (canceled).
